

Archeological Research of India

India is an outstanding country and has only improved over the years. India is a very successful country and improves everyday. Archeologists studying India have a fairly easy job. India doesn't change much. So to find their understanding of their past, they had to look at present India.

Since nothing has changed drastically in India, finding the landforms was very easy. All they had to do was travel all around India and write all the landforms down. *The man-made* objects were easy to find by looking in villages and cities. Their climate was fairly easy to figure out because they just looked at the weather in different areas. To find how they adapted to the climate, just look at their housing, clothing, and agriculture. Their trading could be found by following a good or item in the process of trading and see how the process works.

Housing and agriculture are easily found, too. Housing was found by looking at what the houses were made of. To find how houses were situated, look at if it is in a city or village or all alone. To discover how agriculture took over their environment, they looked at monsoons that made land fertile.

Archeological research really does help us understand the past. It gives us information on landforms, climate, trade, housing, agriculture, and more. When we build our understanding of the past, it gives us ideas for the future. Thus, making our future brighter and better. Archeology is vital to the survival of the future.
